

A

Estimating Interference

t=1 *dog*

$$P_1(\text{rej}) = 0$$

t=2 *dog* *cat*

$$P_2(\text{rej}) = 0$$

t=3 *dog* *cat* *rat*

$$P_3(\text{rej}) = P(\textit{dog}|\textit{cat})$$

t=4 *dog* *cat* *rat* *ant*

$$P_4(\text{rej}) = P(\textit{dog}|\textit{rat}) + P(\textit{cat}|\textit{rat})$$

t=5 *dog* *cat* *rat* *ant* *bee*

$$P_5(\text{rej}) = P(\textit{dog}|\textit{ant}) + P(\textit{cat}|\textit{ant}) + P(\textit{rat}|\textit{ant})$$

B

RT Modelling

$$\text{Log}(\text{RT}) \sim \text{wHS} + \text{IF} + \text{wFA} + \text{Log}(P(\text{rej})) + (1 \mid \text{pid})$$

Factor	Coefficient	<i>p</i>
Intercept	0.08	< 0.01
wHS	-0.36	< 0.01
IF	-0.25	< 0.01
wFA	-0.03	= 0.01
Log(<i>P</i> (rej))	0.26	< 0.01

Conditional $R^2 = 0.32$

BIC = 11429
